

Face Mask Detection — Results

Visual results from model training and evaluation.

Training Accuracy and Loss Curves

The left plot shows training and validation accuracy over 10 epochs. Both curves rise steadily and converge close together, indicating the model is learning well without significant overfitting. The right plot shows training and validation loss over the same epochs. Training loss decreases consistently, while validation loss flattens after around epoch 4, suggesting the model reaches a stable point of generalization on unseen data.

Sample Predictions on Test Images

Actual: with_mask
Predicted: With Mask
Confidence: 100.0%

Actual: with_mask
Predicted: With Mask
Confidence: 99.5%

Predicted: Without Mask
Confidence: 100.0%

Four example predictions made by the trained model on test images. Each caption shows the actual label, the model's predicted label, and its confidence score. The model correctly identifies both masked and unmasked faces across different image styles (photographs and illustrations), with confidence scores ranging from 99.5% to 100%, demonstrating strong classification performance.
